*These courses are designed to develop and extend the knowledge and skills of both training and established foot and ankle surgeons. Techniques of arthroscopic surgery of the joints, ligaments and tendons of the ankle and foot will be presented and demonstrated. Day 1 covers the more common procedures which a foot and ankle surgeon would be likely to need, and Day 2 extends to cover some more advanced and emerging techniques. Delegates will be given ample time to develop their skills in each of these areas using cadaver limbs. Questions and case presentations will be encouraged with an expert and interactive faculty.*
